Patent No. 5993169
GENERAL INFORMATION Michel H
APPLICANT: KLEIN, Michel H
APPLICANT: EWASYSHYN, MALY B
TITLE OF INVENTION: MILTIMERIC HYBRID GENE ENCODING A
TITLE OF INVENTION: CHIMBRIC PROTEIN WHICH CONFERS PROTECTION AGAINST
TITLE OF INVENTION: PARAINFLUENZA VIRUS AND RESPIRATORY SYNCYTIAL VIRUS
NUMBER OF ESQUENCES: 38
NOTHERSPONDENCE ADDRESS:
ADDRESSEE: Sim & McBurney
STREET: 6th Floor, 330 University Avenue
                                                                                   9

Patent No. 5998602
GENERAL INFORMATION:
APPLICANT: Silverman, Robert H.
APPLICANT: Cirino, Nick M.
APPLICANT: Li, Guiying
APPLICANT: Xiao, Wei
TITLE OF INVENTION: RNASE L ACTIVATORS AND ANTISENSE
TITLE OF INVENTION: OLIGONUCLEOTIDES EFFECTIVE TO TREAT RSV INFECTIONS
NUMBER OF SEQUENCES: 29
CORRESPONDENCE ADDRESS:

Patent No. 5993824

GENERAL INFORMATION:

APPLICANT: Whitehead, Stephen S.

APPLICANT: Whitehead, Stephen S.

APPLICANT: Whitehead, Stephen S.

APPLICANT: Thinsz, Katalin

TITLE OF INVENTION: PRODUCTION OF ATTENUATED RESPIRATORY

TITLE OF INVENTION: SYNCYTIAL VIRUS VACCINES FROM CLONED NUCLEOTIDE SEQUENCES

NUMBER OF SEQUENCES: 14

                                                                                                                             vector. The G protein gene into a non-replicating vector. The G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences in upstream of the G protein gene which enhance the G proteins immunoprotective ability. The resulting immunogenic composition will generate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a conditing in a balanced Thi/Th2 immune response and for raising Ab, x

                                              consists of two gene sequences which are linked and encode antigenic regions, these two sequences being derived from two different pathogens (parainfluenza virus (PIV) and respiratory syncitial virus (RSV)). The gene sequences that are particularly used are those which encode PIV-3 F and HIN proteins (AAQ45683, AAQ45684) and RSV F a G proteins (AAQ45684) and RSV F a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                          The respiratory syncytial virus (RSV) G protein can be used in vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen crivator (tPA). The recombinant vector may also comprise sequences activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G proteins immunoprotective ability. The resulting immunogenic composition will generate antibodies directed against the RSV G protein when a chair or a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly resulting in a balanced Th1/Th2 immune response and for raising Ab, by usual immunisation and cell fusion methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATTACATCACAACCACCACCATACTAGCTTCAACAACACCAGGAGTCAAGTCAAACCTG

The proteins are F, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9672
The specification describes a composition comprising a polynucleotide consisting of an antisense oligonucleotide containing a hydroxy group, complementary to the genomic or antisenonic strand of a negative-strand RNA virus, and an activator of RNAse L. The polynucleotide is used to inhibit, or treat, infection by negative-strand RNA viruses, specifically respiratory syncytial virus (RSV) but also (para)influenza, mumps, and rables. The polynucleotide can cross cell membranes without requiring carriers or permeabilizing agents, and can selectively cleave the RNA targeted by the oligonucleotide. The present sequence represents the polynucleotide sequence of RSV strain A2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

A human respiratory syncytial virus (RSV) anti-genome sequence (AAT63430) is the 5' to 3' positive-sense sequence of RSV; the genomitself is negative-sense. It was synthesised in segments by RT-FCR using intracellular RSV mRNA or genomic rRNA isolated from purified viruses as template. Restriction site markers were intoduced by incorporating the changes into the primers used for RT-FCR. The recombinant sequence can be expressed with a nucleocapsid protein, a large polymerase protein and an RNA elongation factor to produce isolated infectious RSV particles useful for generating vaccines against RSV. Recombinant RSV genome or also be used as a vector for gene therapy of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence was used in the preparation of a novel polymucleotide, comprising an antisense oligonucleotide, with a polymucleotide, comprising an antisense oligonucleotide, with a polymucleotide arone end, that is complementary to 15-20 bases of the driving arone end of a respiratory syncytial virus (RSV), a linker attached to the OH-end of the antisense oligonucleotide and of a respiratory syncytial virus (RSV), a linker attached to the OH-end of the antisense oligonucleotide and polymucleotide can be transported across the call membranes without carriers or permeability agents, and once introduced destroys antisense target RNA. It also inhibits RSV infection in vitro in a superior manner to the conventional drug, ribavirin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ATTACATCACAAACCACCACCATACTAGCTTCAACAACACCAGGAGTCAAGTCAAACCTG

```
This is the 5'-3' positive sequence nucleotide sequence of respiratory syncytial virus (RSV) D46. The genome is negative-sense; the complete nucleotide sequence of the negative-sense; the complete nucleotide sequence of the wild-type B-1 virus has also been determined (see AAV1752).

A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocapsid (N) protein, a nucleocapsid polymerase elongation factor, where the recombinant RSV has at polymerase elongation factor, where the recombinant RSV has at temperature-sensitive (Es) substitution at amino acid Phe521, along two attenuating mutations, one of the mutations specifying a temperature-sensitive (Es) substitution at amino acid Phe521, along two attenuating mutations, one of the mutations and phe521, along the substitution in the gene-start sequence of gene or a ts nucleotide substitution in the gene-start sequence of gene or a ts nucleotide substitution in the gene-start sequence of gene or a comprises a recombinant RSV paintijele which a RNA polymerase elongation factor, where the (anti)genome is modified:

(i) to ablate or modulate expression of a SH, NSI, NS2 or Gene or a cis-acting regulatory sequence; and (ii) by a termination codon introduced within a selected gene, or by a change in sequence, position or presence of a GS or GE transcription signal relative to the selected gene, or by a change in sequence, position or presence of a GS or GE transcription signal relative to the selected gene, (2) an expression vector; and (3) an RSV strain selected gene, or by a change in sequence or a selected gene, or by a change in sequence or a transcription and a capacited from CDES (ATCC WR 2453), cpts 248/404 (ATCC WR 2451), cpts 248/4009 (ATCC WR 2451), cpts 248/4009 (ATCC WR 2451) or cpts 530/1030 (ATCC WR 2452), or cpts 530/1030 (ATCC WR 2452), or cpts 530/1030 (ATCC WR 2452), or correspond a similar the immune system of a mindividual to induce in a vaccine to similar by a mindividual to induce a similar by a mindividual to induce a 
                                                                                                                                                                                                                                                           Attenuated respiratory syncytial virus vaccines - useful to protect
individuals against RSV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15223 BP; 5921 A; 2704 C; 2361 G; 4236 T; 1 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of the 5' to 3' positive-sense sequence of human respiratory syncytial virus (RSV); the genome sequence of human respiratory syncytial virus (RSV); the genome is table is negative-sense. This antigenome cDNA, termed D46, was synthesized in segments by RT-PCR washn or genome RNA isolated from as primers and intracellular RSV mRNA or genome RNA isolated from convital driplet contributed by the 77 promoter, 4 sequence markers (see AAA88745-47) at positions 1099 (which adds 1 mucleotide to the length), 1139, 5611 and 7559, a ribozyme and tandem T7 terminators, and a single nonviral 3'-phosphorylated residue contributed to the 3' end by ribozyme cleavage. The invention provides an isolated infectious chimeric RSV comprising a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a clarge polymerase protein (L), an RNA polymerase elongation factor, and a partial or complete RSV genome or antigenome of one RSV strain or subgroup virus. The chimeric RSV is clifferent RSV strain or subgroup virus. The chimeric RSV is clifferent RSV strain or subgroup virus. The chimeric RSV is clifferent and attenuated, preferably by introduction of selected mutations. It is useful as a vaccine against RSV, which causes diseases such as pneumonia and brononfolitis in infants. The infants of the partial and proper multiple DSV strain and receive mentaled to induce protection of selected immune System of an individual is stimulated to induce protection of selection and individual is stimulated to induce protection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CACAAAGTCACACTAACAACTGCAATCATACAAGATGCAACAAGCCAGATCAAGAACACA

The construct can be used to immunize animals and humans against respiratory syncytial virus. The use of transgenic plants to generate the antigen allows the production of greater amounts of

The virus may be administered in combination with an antigenic fragment. The virus may be administered in combination with an antiviral tementherapeutic compound. Two or more viruses corpositions of the comprising different PWN proteins nay be co-administered. Compositions comprising the virus are useful for eliciting a humoral and/or cellular immune response to a PWN in a mammal, particularly a human. Further a recombinant Sendai virus comprising an exogenous nucleic acid encoding a second pWN protein is also administered and priming and/or boosting humoral or cellular immune response comprises administering one or more of a recombinant or isolated PWN protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral vector encoding a PWN protein. The recombinant virus is useful as an effective vaccine against hPV or RSV (the major causes of paediatric interest in target calls, providing a positive medical impact on interest in target calls, providing a positive medical impact on into stem cells effects a cure for sickle cell disease or beta-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               thalassaemia. The recombinant virus may also prove effective in conferring immunity to human immunodeficiency virus (HIV) infection. The Sendai virus replicate at level that is high enough to induce sufficient immunity, but does not cause any harm to human recipient. The present sequence encodes a respiratory syncytial virus (RSV) G protein (heavily glycosylated protein), a PMV protein suitable for expression by the recombinant virus of the invention.
                                                                                                                                                                                                                                                                                                                                                                            Recombinant Sendai virus useful in vaccines to protect infection by paramyxoviruses, comprises exogenous nucleic acid encoding paramyxovirus protein or its antigenic fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a recombinant Sendai virus comprising an

It has been inserted into plasmid pcDNA3 (see AAV38297) to create plasmid pGT4. This plasmid contains a human cytomegalovirus immediate early promoter and the RSVG gene portion such that when an in-frame fusion is made, the resultant fusion protein may be transported to, and anchored in, a mammalian cell

membrane where it can be exposed to the host immune system.

Insertion of pneumococcal surface protein A (PBpA) coding sequence created plasmid pKSD2601. Intramuscular immunisation of BALBA/C mice with pKSD2601 induced protection against an otherwise lethal cohallenge with a capsular type 3 pneumococcus. A claimed plasmid for expression of pneumococcal epitope DNA in extravoric cells includes a promoter for driving expression in a eukaryotic cells includes a promoter for driving expression in a eukaryotic cells (e.g. HCMV-IE), DNA encoding a leader sequence (e.g. of RSVG) can DNA encoding a pneumonoccal epitope such as PspA. The invention also provides a vaccine comprising the plasmid and a suitable carrier or diluent, and optionally one or more cytokines or DNA encoding them, or a bacterial delivery system. The vaccine is used to elicit an immunological response in a host, including humans, susceptible to pneumococcal infection or sepsis. The plasmid can also be used to express a pneumococcal epitope of interest in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 696 BP; 284 A; 211 C; 78 G; 123 T; 0 other;

The genome is negative-sense to be start by positive-sense sequence of D46 is provided in AAV17553.

A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a large polymerase protein (L), and a RNA polymerase elongation factor, where the recombinant RSV has at least two attenuating mutations, one of the mutations specifying a temperature-sensitive (ES) substitution at amino acid Rhe521, and the RSV polymerase gene or a ts nucleotide substitution in the gene-start sequence of gene MZ. Comprises a recombinant RSV (anti)genome, N, P, and L proteins, RNA polymerase elongation factor, where the (anti)genome is modified. (i) to ablate or modulate expression of a SH, NS1, NS2 or G gene or introduced within a selected gene, or by a change in sequence, position or presence of a GS or GB transcription signal relative to the selected gene; (2) an expression vector; and (3) an RSV strain selected from cpts RSV 248 (ATCC WR 2450), opts 248/404 (ATCC WR 2452). Cpts 830/1009 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2452) or E-1 cp52/285 (ATCC WR 2451) or cpts 530/1009 (ATCC WR 2452) or estimate recombinant RSV and RSV particles are used in a vaccine attenuated recombinant RSV and RSV particles are used in a vaccine of estimation of estimated recombinant RSV and RSV particles are used in a vaccine of estimation of estimated attenuated recombinant RSV and RSV particles are used in a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 CACAAAGICACTAACAACIGCAAICATACAAGAIGCAACAAGCCAGAICAAGAACACA

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
